

B.) Amendments to the Claims

Claims 1 – 7 (Cancelled)

1 8. (Previously Presented) A server system, operable in connection with
2 a central repository of confidential user data, to support the selective distribution
3 of confidential user-information to authorized partner sites on behalf of users of
4 client computer systems, which have specific confidential user data requirements,
5 said server system comprising:

6 a) a connection to a database storing confidential user data within a user
7 account and wherein datums of confidential user data are selectable based on an
8 account identification and server datum identifications;

9 b) a computer system, coupleable to a communications network and,
10 through said connection, to said database, said computer system being
11 responsive to a network request received from a partner site relative to a client
12 computer system, wherein said network request provides said account
13 identification and said server datum identifications, wherein said server datum
14 identifications have a mapped relationship to the confidential user-information
15 requirements of said partner site with respect to said user account, which is
16 expressed as partner datum identifications, and wherein said computer system
17 supports the determination of said mapped relationship for said partner site and
18 provides for the generation and distribution of a mapped relationship definition
19 to said partner site packaged to be sent as part of said network request in
20 response to a single click on said partner site, wherein said mapped relationship
21 definition implements said mapped relationship in a form evaluateable by said
22 server system upon receipt as part of said network request to enable said server
23 system to provide a network response to said partner site containing the datums
24 of confidential user-information corresponding to said partner datum
25 identifications, wherein said partner datum identifications and corresponding
26 datums of confidential user-information are exclusive of executable code required
27 to be executed on said client computer system; and

28 c) a mapping processor, coupled to receive said mapped relationship
29 definition, that implements combinatorial and logical functions to autonomously
30 convert server datums to partner datums through a process defined by said
31 mapped relationship definition.

Claims 9 – 11 (Cancelled)

1 12. (Currently Amended) The server system of Claim 8 wherein said computer
2 system is coupleable through said communications network to said client system
3 operated by a user, wherein said server system establishes a user account
4 identification on said client system, and wherein said client system autonomously
5 provides said user account identification to said server system in connection with
6 said network request.

Claims 13 – 20 (Cancelled)
